BPH-200 BUGGY DRILL RIG

The BPH-200 Buggy Drill Rig is the boring machine of choice for environmentally sensitive areas including urban projects such as communications grounding and other jobs where size is a consideration.

The powerful 78 horse power engine coupled with a special hydraulic top head gives the BPH-200 the capability to drill through most formations to depths of 200 feet.

When operated in conjunction with one of our many different compressor models and our downhole hammers even the hardest rock is not a problem. So whatever your drilling needs are from soil testing to communications installations American Drilling Systems can handle it.
